Hiring team
Mistral AI

Dear Mistral hiring team,

I am applying for the AI Deployment Strategist position in Madrid. My route into AI deployment is through enterprise infrastructure: I work in a BaFin/ECB-supervised bank, lead its RHEL 8 to 9 migration project, and help Application Owners turn operational requirements into secure, supportable systems. In parallel, I contribute to internal Azure AI Foundry and Document Intelligence prototypes and build AI-enabled products outside my core role.

This combination is why the position interests me. I understand the practical constraints that appear when a useful AI idea meets a regulated environment: infrastructure boundaries, security review, data handling, integration, operational ownership, and the need to explain decisions clearly to people with different technical backgrounds. My current work requires coordination across teams, structured change, and calm communication when systems or requirements are unclear.

I have also built and published two Kotlin/Firebase applications. IntelliAuto combines vehicle-management workflows with ML Kit OCR and an AI mechanic assistant. IntelliFlow is a privacy-focused personal-finance application with offline operation, controlled cloud sync, and DeepSeek-backed spending insights. Through my technical portfolio, I document local model deployment with llama.cpp and GGUF across Intel, AMD, and RK3588 systems, including concurrency, memory, latency, and power trade-offs.

I do not come from a conventional technical-sales background, and I would not present my internal prototypes as customer production deployments. What I offer is a grounded understanding of enterprise operations, evidence that I can learn and ship independently, and experience translating technical needs across application, infrastructure, and stakeholder boundaries. I am now looking to make AI adoption and deployment my primary responsibility.

Mistral's focus on full-stack AI systems that customers can run under their own security and infrastructure constraints is especially relevant to my background. I would welcome the opportunity to discuss how my experience in regulated platforms, practical LLM deployment, and technical coordination could contribute to customer discovery, proofs of value, and successful implementation.

Kind regards,
Sergio Barrientos
