Hiring team
OpenAI

Dear OpenAI hiring team,

I am applying for the Solutions Engineer, Large Enterprise position in Madrid. I work as a Linux and virtualization engineer in a BaFin/ECB-supervised bank, where I lead a RHEL 8 to 9 migration and work with Application Owners to turn technical requirements into secure, supportable infrastructure. I also contribute to internal Azure AI Foundry and Document Intelligence prototypes and have independently shipped two AI-enabled products.

The role's combination of technical advisory, demonstrations, security awareness, and communication across business and engineering audiences matches the direction in which my work has been developing. In regulated banking, a technically sound idea is only useful when stakeholders understand it, the security boundaries are clear, and the implementation can be operated and audited. My daily work sits across those boundaries: platform engineering, application requirements, change coordination, incident resolution, and documentation.

Outside my core role, I built and published IntelliAuto and IntelliFlow. IntelliAuto combines vehicle-management workflows with ML Kit OCR and an AI mechanic assistant. IntelliFlow is a privacy-focused personal-finance application with offline operation, controlled cloud sync, and DeepSeek-backed spending insights. I also publish reproducible work on local LLM deployment with llama.cpp and GGUF, including latency, memory, concurrency, KV-cache, and hardware trade-offs across Intel, AMD, and RK3588 systems.

My background is not the conventional five-year technical pre-sales path described in the posting. I would not claim C-level sales ownership or customer production deployments that I have not led. The case for considering me is different: I already understand enterprise infrastructure and security constraints, I communicate clearly with technical and non-technical stakeholders, and I have repeatedly learned unfamiliar technology and turned it into working systems. Feedback from my managers has consistently emphasized reliability, stakeholder communication, and my contribution to AI work beyond my formal remit.

I would bring that operational grounding to OpenAI's Technical Success team while continuing to develop the commercial and customer-facing depth required by the role. I would value the opportunity to discuss how my experience in regulated infrastructure, hands-on GenAI products, and bilingual stakeholder communication could support enterprise customers adopting ChatGPT and the OpenAI API safely and effectively.

Kind regards,
Sergio Barrientos
